Tillward

BTC-backed working capital

Repay as customer receipts arrive

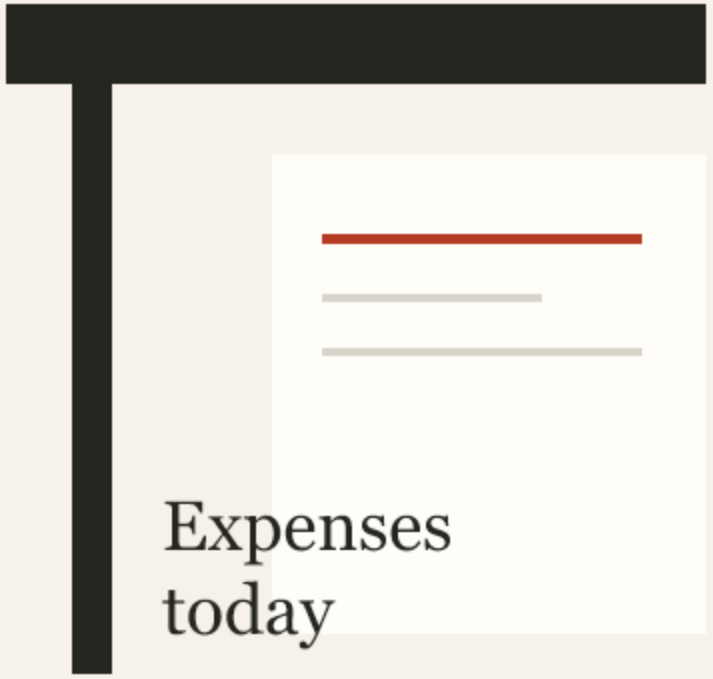

An owner-controlled MUSD workspace on Mezo

Built by ElseMade / Mezo Buildathon / Public testnet

Business expenses arrive before receipts

For an independent agency or seller that holds BTC and collects MUSD

Operating expenses come due while customer payments are still outstanding. Borrowing can supply cash, but the business still has to decide when to repay.

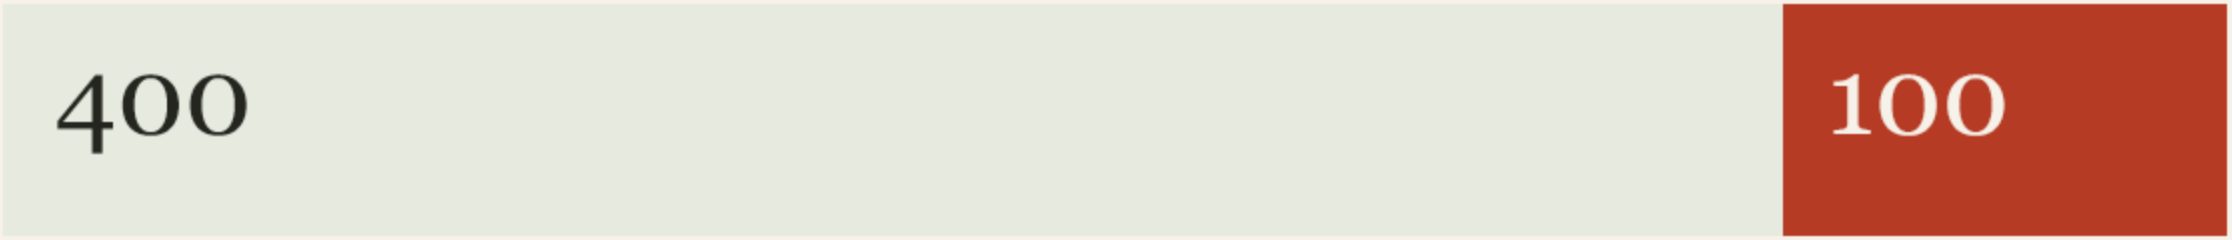

Target audience and demand remain hypotheses to validate with pilots

A receipt does two jobs

500 MUSD

Final customer payment

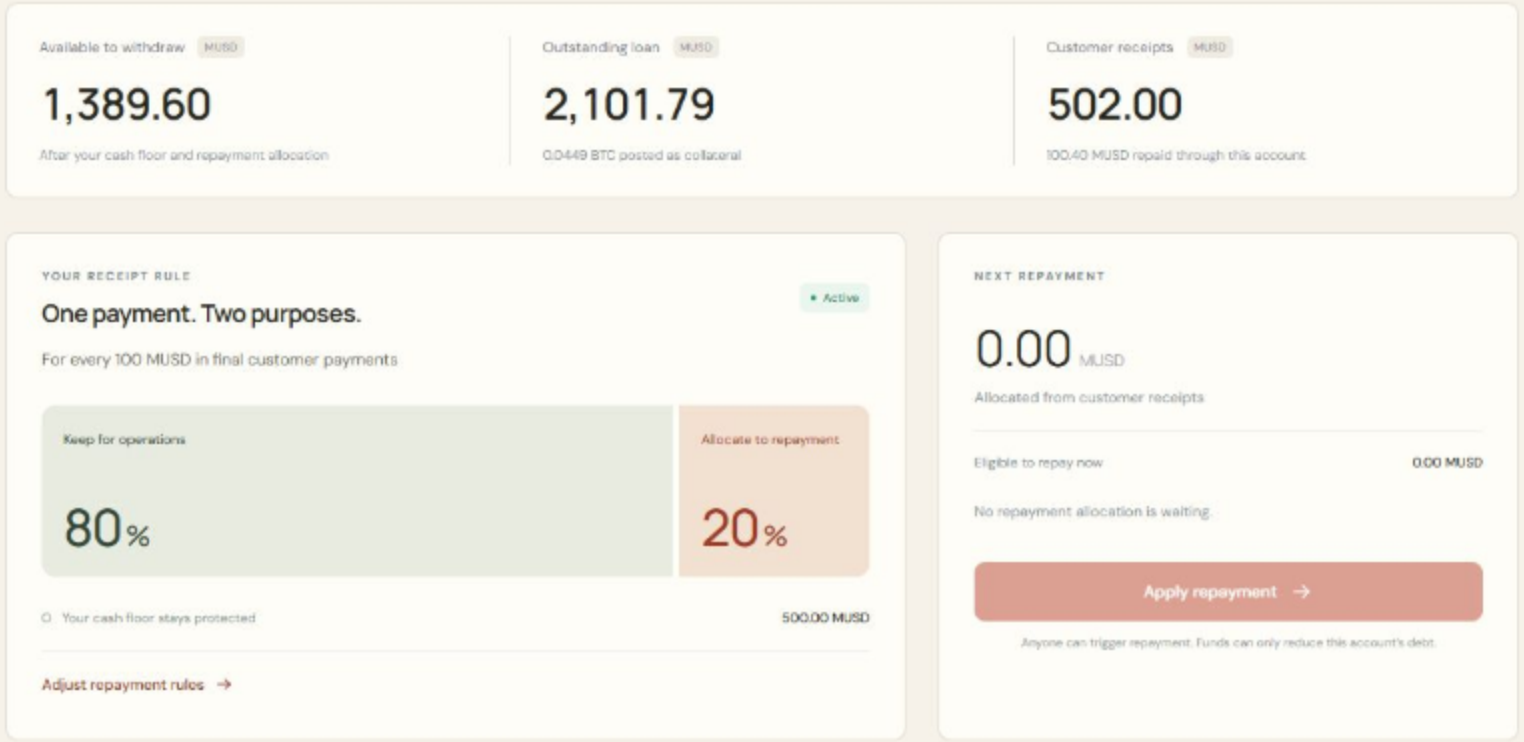

Remains in the business account

Repays native debt

Recorded testnet receipt with a 20% rule. Withdrawal still respects the cash floor and allocation

One workspace from loan to repayment

Borrow against BTC

Choose your share and cash floor

Invoice customers. Watch receipts reduce debt.

Public demo captured read-only on 25 October 2026, at Mezo testnet block 16,367,839

The repayment reaches native Mezo debt

2,000	500	100
MUSD borrowed	MUSD receipt	MUSD repaid

A separate sample customer paid the invoice. Settlement reduced the business account’s native loan debt and burned the matching MUSD.

Historical public testnet integration proof. Sample customer funds came from the test loan

The owner controls the operating room

Repayment share	Choose how much of each final payment goes toward debt.
Cash floor	Reserve a minimum balance for operating expenses.
Pause or close	Pause future allocation, top up, close the loan and recover BTC.

BTC collateral remains exposed to the underlying protocol's liquidation and redemption mechanics

The full testnet journey works

0.045 BTC

Returned to the owner after loan closure

Rabby in Chrome completed borrowing, invoice payment, repayment, top-up and full exit. Independent chain checks matched the debt, token burn and BTC return.

Three accounts

Auto-enrolled by the hosted testnet keeper

Browser QA payer was the owner. Separate-customer proof is recorded in the original integration

A working product, ready for pilot feedback

The next question is customer fit

Find BTC-holding agencies and sellers already collecting MUSD. Validate how they choose repayment shares and cash floors, then test the workflow in their day-to-day operations.
